

# Neutrino-nucleus cross section measurements at MINER $\nu$ A

Philip Rodrigues

April 18, 2014

# Outline

Why neutrino oscillation measurements need precise understanding of neutrino-nucleus interactions, and how MINER $\nu$ A is contributing

# Oscillations and cross sections

# Neutrino oscillation experiments need precise cross sections

- Oscillation probability:

$$P(\nu_\mu \rightarrow \nu_\mu) = 1 - \sin^2 2\theta \sin^2 \left( \frac{\Delta m^2 L}{E_\nu} \right)$$

(Nature, Experimental)

# Known knowns and known unknowns

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} =$$

$$\begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

# Known knowns and known unknowns

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

- ▶  $s_{ij} = \sin \theta_{ij}$ ,  $c_{ij} = \cos \theta_{ij}$
- ▶ Measured, Unmeasured

# Known knowns and known unknowns

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

- ▶  $s_{ij} = \sin \theta_{ij}$ ,  $c_{ij} = \cos \theta_{ij}$
- ▶ Measured, Unmeasured

# Measuring $\delta$ , hierarchy

- ▶  $P(\nu_\mu \rightarrow \nu_e)$ ,  $P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e)$  depend on  $\delta$ , hierarchy

Source: HyperK LOI, arXiv:1109.3262. NH.  $\sin^2 2\theta_{13} = 0.1$

- ▶ Need precise signal and background predictions
- ▶ Infer  $E_\nu$  from final state particles

# Knowing the known knows better

- ▶  $P(\nu_\mu \rightarrow \nu_\mu)$  depends on  $\theta_{23}$ ,  $\Delta m_{32}^2$
- ▶ Eg, T2K  $\nu_\mu$  spectrum at SuperK:

arXiv:1403.1532

# Many ingredients needed to model $\nu A$ cross sections

$\nu$ -nucleon model

H, D<sub>2</sub> data

- Model neutrino scattering on free nucleons

# Many ingredients needed to model $\nu A$ cross sections

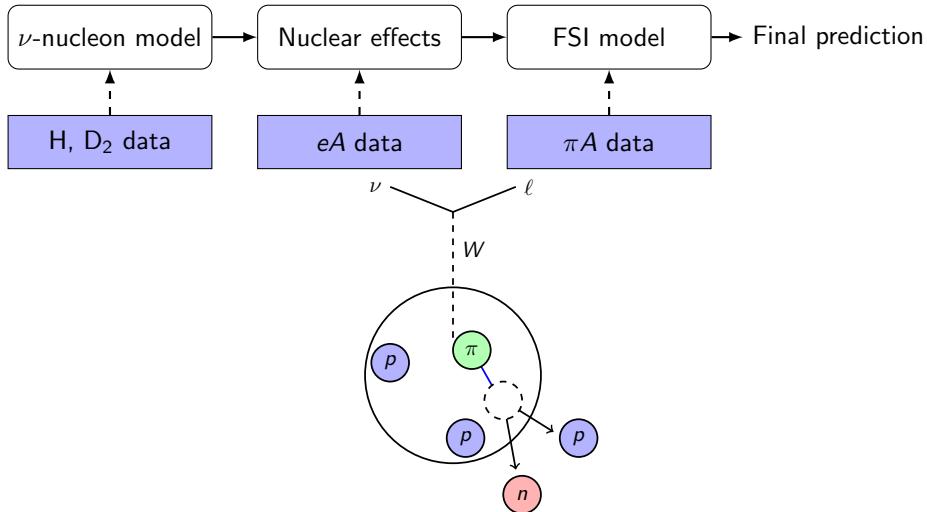

- Add effects due to nucleon bound in nucleus

# Many ingredients needed to model $\nu A$ cross sections

- ▶ Model reinteractions of hadrons exiting nucleus

# MINER $\nu$ A CCQE analysis

► Aims:

1. Make shape-only comparisons of  $\frac{d\sigma}{dQ^2}$  to nominal model and models with multinucleon effects
2. Look at energy near the interaction vertex for evidence of multinucleon emission

► In both  $\nu$  and  $\bar{\nu}$  data

# CCQE selection

# CCQE selection

- ▶ Fiducial volume
- ▶ MINOS matched track
- ▶  $\nu$ :  $\leq 2$  isolated showers
- ▶  $\bar{\nu}$ :  $\leq 1$  isolated showers

# CCQE selection

- ▶ Require low non-vertex recoil energy
- ▶  $\nu$ :  $r < 300$  mm
- ▶  $\bar{\nu}$ :  $r < 100$  mm

# Recoil energy cut

## Neutrino mode

## Antineutrino mode

# Final event selections

No of events 29,620

Efficiency 47%

Purity 49%

- ▶ Constrained background using fit to  $E_{\text{recoil}}$  distribution
- ▶ Then subtract BG, unfold, efficiency correct to get  $\sigma$
- ▶ But first, systematics...

No of events 16,467

Efficiency 54%

Purity 77%

# Systematics

## ► Flux

- Tune to NA49 data
- Remaining 10–15% uncertainties
- Cancel in shape analysis

# Systematics

- ▶ Flux
  - ▶ Tune to NA49 data
  - ▶ Remaining 10–15% uncertainties
  - ▶ Cancel in shape analysis
- ▶ Muon energy scale
  - ▶ Muon  $p$  scale known to 2–3%

MINOS range

$\pm 2\%$  (all  $p_\mu$ )

MINOS curvature

$\pm 2.1\%$  ( $p_\mu < 1 \text{ GeV}/c$ )

$\pm 3.3\%$  ( $p_\mu > 1 \text{ GeV}/c$ )

MINER $\nu$ A

$\pm 11 \text{ MeV}$  (mass model)

$\pm 30 \text{ MeV}$  ( $dE/dx$ )

# Systematics

- ▶ Area normalize, then take ratio to GENIE
- ▶ Models:

GENIE — Quasi-independent nucleons in a mean field

NIM A614, 87 (2010)

$M_A = 1.35$  — Modified nucleon form factor from MiniBooNE data

Phys. Rev. D81, 092005 (2010)

TEM - - - Empirical multinucleon effect based on eA data

Eur. Phys. J. C 71:1726 (2011)

# Vertex energy

- ▶ Multinucleon emission expected in interactions with correlated nucleons
  - ▶ Look for excess energy in the vertex region excluded from recoil cut

- ▶ Harder spectrum in  $\nu_\mu$  mode data than in MC, but not in  $\bar{\nu}_\mu$  mode

## Vertex energy

- ▶ Assume an extra proton
- ▶ Use spatial distribution of energy to infer KE distribution of extra proton

# Vertex energy

- ▶ Assume an extra proton
- ▶ Use spatial distribution of energy to infer KE distribution of extra proton

- ▶ Extra proton preferred in  $(25 \pm 9)\%$  of  $\nu_\mu$  CCQE events
- ▶ No increase preferred in  $\bar{\nu}_\mu$  mode

# CCQE conclusions

- ▶ Shape-only comparison of  $\frac{d\sigma}{dQ^2}$  in CCQE  $\nu_\mu/\bar{\nu}_\mu$  scattering
- ▶ Disagreement with model used in generators (and thus osc expts)
  - ▶ Better agreement with TEM model
- ▶ Disagreement in vertex energy in  $\nu$  mode.
  - ▶ Consistent with  $np$  initial state correlated pairs
- ▶ Next steps:
  - ▶ Increased statistics
  - ▶ Michel veto
  - ▶  $\frac{d^2\sigma}{dp_\mu d\cos\theta_\mu}$

# Charged-current $\pi^{\pm}$ production

# Neutrino-induced charged pion production

- Major background in oscillation experiments (T2K  $\nu_\mu$  again):

- But MiniBooNE data on  $\text{CH}_2$  suggest shortcomings in models

# MINER $\nu$ A charged pion production

- ▶ Events with single charged pion exiting nucleus,  $W < 1.4$  GeV
- ▶ Compare pion kinematics with available models

# MINER $\nu$ A charged pion production

- ▶ Events with single charged pion exiting nucleus,  $W < 1.4$  GeV
- ▶ Compare pion kinematics with available models

- ▶ Select *stopping* pions using  $dE/dx$  and  $e$  from  $\pi \rightarrow \mu \rightarrow e$

# MINER $\nu$ A charged pion production: results

- ▶ Shape-only comparisons to generator and model predictions

- ▶ Shape measurement stats-limited
- ▶ Main systematics: hadronic energy response, neutrino interaction models

# Recap

- ▶ MINER $\nu$ A is constraining cross sections needed for oscillation experiments:
  - CCQE evidence for nuclear effects not currently simulated
  - CC $\pi^{\pm}$  consistency with current model
- ▶ And more:
  - ▶ CC inclusive ratios on different nuclei  
arXiv:1403.2103
  - ▶  $\nu_{\mu}-e$  scattering  
[http://theory.fnal.gov/jetp/talks/WC\\_talk\\_J.Park.ppt](http://theory.fnal.gov/jetp/talks/WC_talk_J.Park.ppt)
  - ▶  $\nu, \bar{\nu}$  coherent pion production
  - ▶ CCQE proton kinematics
  - ▶ CC  $\pi^0$  production
  - ▶  $\nu_e$  CCQE
  - ▶ Kaon production

# Backup slides

# Because it's there

- ▶ “Because it's there!”
- ▶ Not well-known at  $E_\nu \sim 1$  GeV
  - ▶ Few measurements with few events
  - ▶ Large syst uncertainties, esp flux
- ▶ Weak-only probe of nucleon, nuclear dynamics
  - ▶ Understand strongly-coupled systems

# $\nu$ cross sections around 1 GeV

Higher  $E_\nu, Q^2 \rightarrow$

- ▶ Charged- and neutral-current processes (CC, NC)
- ▶ Interaction with nucleon most significant
- ▶  $Q^2 = (4\text{-momentum transferred to nucleon})^2$

## $\nu$ cross sections around 1 GeV

- ▶ Charged- and neutral-current processes (CC, NC)
- ▶ Interaction with nucleon most significant
- ▶  $Q^2 = (4\text{-momentum transferred to nucleon})^2$
- ▶ Nucleon bound inside nucleus
  - ▶ “Initial state interactions”: Binding energy, Pauli blocking, Initial momentum
  - ▶ Final state interactions (FSI) change hadron types and momenta

# Neutrino mixing unknowns

- ▶ Neutrino oscillation knowns:
  - ▶ Three mixing angles  $\theta_{12}$ ,  $\theta_{23}$ ,  $\theta_{13}$
  - ▶ Mass splittings  $\Delta m_{12}^2$ ,  $|\Delta m_{23}^2|$

# Neutrino mixing unknowns

- ▶ Neutrino oscillation knowns:
  - ▶ Three mixing angles  $\theta_{12}$ ,  $\theta_{23}$ ,  $\theta_{13}$
  - ▶ Mass splittings  $\Delta m_{12}^2$ ,  $|\Delta m_{23}^2|$
- ▶ Unknowns:
  - ▶ CP-violating phase  $\delta$
  - ▶ Sign of  $\Delta m_{23}^2$

# Neutrino mixing unknowns

- ▶ PMNS matrix relates mass and flavour eigenstates:

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13} \exp(-i\delta) \\ 0 & 1 & 0 \\ -s_{13} \exp(i\delta) & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

- ▶  $s_{ij} = \sin \theta_{ij}$ ,  $c_{ij} = \cos \theta_{ij}$
- ▶ Measured, Unmeasured
- ▶ Also unknown: ordering of mass eigenstates:

# Cross sections: What do we know so far?

$\nu_{\mu}$ -nucleon CC cross sections

$\bar{\nu}_{\mu}$ -nucleon CC cross sections

G. Zeller and J. Formaggio, Rev. Mod. Phys. 84, 1307–1341 (2012)

- ▶ Not precisely known for  $E_{\nu} \sim 1$  GeV
- ▶ Multiple contributing processes

# Cross sections: What do we know so far?

G. Zeller and J. Formaggio, Rev. Mod. Phys. 84, 1307–1341 (2012)

- ▶ Not precisely known for  $E_{\nu} \sim 1$  GeV
- ▶ Multiple contributing processes

# Cross sections: What do we know so far?

G. Zeller and J. Formaggio, Rev. Mod. Phys. 84, 1307–1341 (2012)

- ▶ Not precisely known for  $E_{\nu} \sim 1$  GeV
- ▶ Multiple contributing processes
- ▶ In  $\nu A$ , observe  $\sigma_{\nu N} \otimes \sigma_A \otimes \sigma_{FSI}$

# Where do cross sections come in?

$$N_{\text{FD}} = \Phi_{\nu_\alpha} \times P_{\nu_\alpha \rightarrow \nu_\beta}(E_\nu) \times \sigma_{\nu_\beta}(E_\nu) \times \mathbf{R}(E_\nu, E_{\text{visible}}) + N_{\text{bg}}$$

- ▶  $\nu_e$   $\sigma$  unmeasured.  $\sigma_{\nu_e}, \sigma_{\nu_\mu}$  differences  
M. Day and K. S. McFarland, Phys. Rev. D 86, 053003 (2012)
- ▶  $E_\nu \leftrightarrow E_{\text{visible}}$  from cross section MC
  - ▶ Čerenkov: Lepton kinematics + CCQE hypothesis (T2K, MiniBooNE)
  - ▶ Sampling calorimeters:  $E_{\text{lepton}} + E_{\text{had}}$  (MINOS, No $\nu$ a)
- ▶ And all the same issues for backgrounds
- ▶ Near detectors partially cancel some of these effects, but still:

Precision  $\nu$  oscillation experiments need precision  $\nu$ -nucleus cross sections

# MINER $\nu$ A reconstruction

# Calibration

- ▶ Plentiful supply of  $\mu$  from  $\nu$  interactions in rock

# Calibration

- ▶ Plentiful supply of  $\mu$  from  $\nu$  interactions in rock
- ▶ Set energy scale. Cross check with Michel electrons ( $\mu^- \rightarrow e^- \bar{\nu}_e \nu_\mu$ )
- ▶ Also used to measure pixel-to-pixel PMT crosstalk

# CC inclusive nuclear target ratios

# CC inclusive ratios

G. Zeller and J. Formaggio, Rev. Mod. Phys. 84, 1307–1341 (2012)

$$Q^2 = 2E_\nu(E_\mu - p_\mu \cos \theta_\mu) \quad \nu = E_\nu - E_\mu \quad x = \frac{Q^2}{2M\nu}$$

# CC inclusive ratios

- ▶ “EMC effect” well-studied but not well-understood
- ▶ What can neutrino data say?
  - ▶ Sensitive to a different combination of structure functions  $F_1$ ,  $F_2$ ,  $xF_3$

# CC inclusive ratios in MINER $\nu$ A

Figure: B. Tice

- ▶ We have nuclear targets. But not D<sub>2</sub>...
- ▶ Strategy:
  1. Select CC  $\nu_{\mu}$  events in nuclear targets and scintillator (CH)
  2. Construct ratios  $\langle \text{nucleus} \rangle / \text{CH}$  in  $E_{\nu}$  and  $x$

# Selection

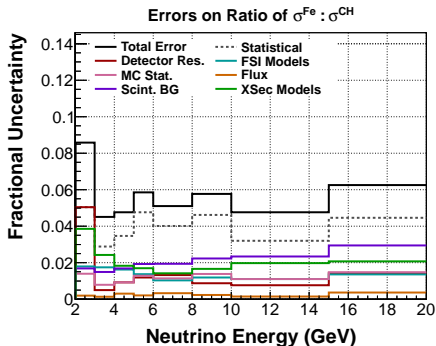

1. MINOS-matched track
  2. Vertex in nuclear target or scintillator plane immediately downstream
- ▶ Only significant background: events on plastic
  - ▶ Reconstruct  $E_\mu$ ,  $\theta_\mu$ ,  $E_{\text{had}}$  to calculate  $E_\nu$ ,  $Q^2$ ,  $x$

# Plastic background subtraction

- ▶ Use data CC  $\nu_\mu$  events in scintillator to predict background
- + Geometric acceptance correction from muon gun
- + Efficiency correction as fn of  $E_{\text{had}}$  from simulation

# Systematics

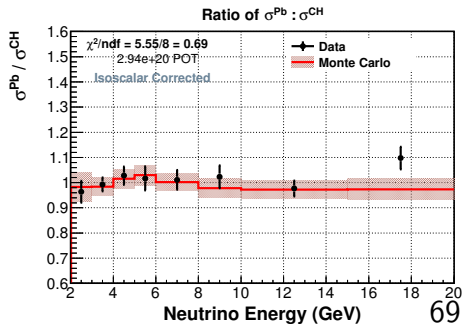

- ▶ Evaluated in similar way to CCQE analysis
- ▶ Most significant new one is plastic background

# Results in $E_\nu$

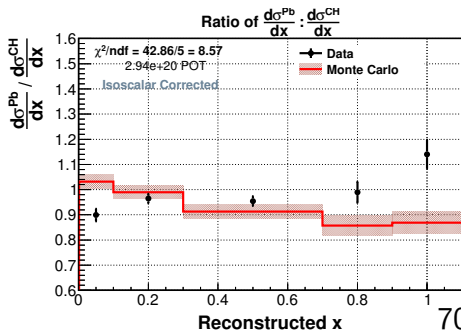

- ▶ Unfolded to true  $E_\nu$
- ▶ No evidence of systematic discrepancy with generator

# Results in $x$

- ▶ Deficit at low  $x_{reco}$ , excess at high  $x_{reco}$
- ▶ Both increase with size of nucleus

## Conclusions and next steps

- ▶ Suggestions of unmodelled nuclear effects in  $x$  but not  $E_\nu$
- ▶ Analysis with future data
  - ▶ 10× more stats
  - ▶ Higher  $E_\nu \Rightarrow$  More DIS
  - ▶ Reach to lower  $x$

## Predict spectrum of background using:

### Reconstruction Efficiency

- Unique correction for each nuclear target
- Errors are MC stat. and an additional correlated error
  - Additional uncertainty scale determined by adding uncorrelated uncertainty on top of stat. until  $\chi^2/dof = 1$
  - Additional uncertainty applied as correlated event-to-event and target-to-target

$$\left(\frac{d\sigma}{dx}\right)_i = \frac{\sum_j U_{ij}(d_j - b_j)}{\epsilon_i(\Phi T)\Delta x_i}$$

A separate estimated background for **data** and **MC**

# Kinematic Content

## Signal Kinematics

$2 < \text{Neutrino Energy} < 20 \text{ GeV}$

$0 < \text{Muon Angle} < 17 \text{ deg}$

Invariant hadronic mass

$$W = \sqrt{M^2 + 2M\nu - Q^2}$$

# Reconstruction Efficiency

$$\left(\frac{d\sigma}{dx}\right)_i = \frac{\sum_j U_{ij}(d_j - b_j)}{\epsilon_i(\Phi T)\Delta x_i}$$

**Signal Kinematics**  
 $2 < \text{Neutrino Energy} < 20 \text{ GeV}$   
 $0 < \text{Muon Angle} < 17 \text{ deg}$

**MINOS-match requirement**  
 Muon momentum  
 threshold  $\sim 2 \text{ GeV}$

**MINOS-match requirement**  
 Geometric acceptance primary  
 driver for efficiency loss  
 Angular threshold  $\sim 17 \text{ deg}$

Inclusive
