

# **(g-2) FAST KICKER STATUS REPORT**

Cornell kicker team

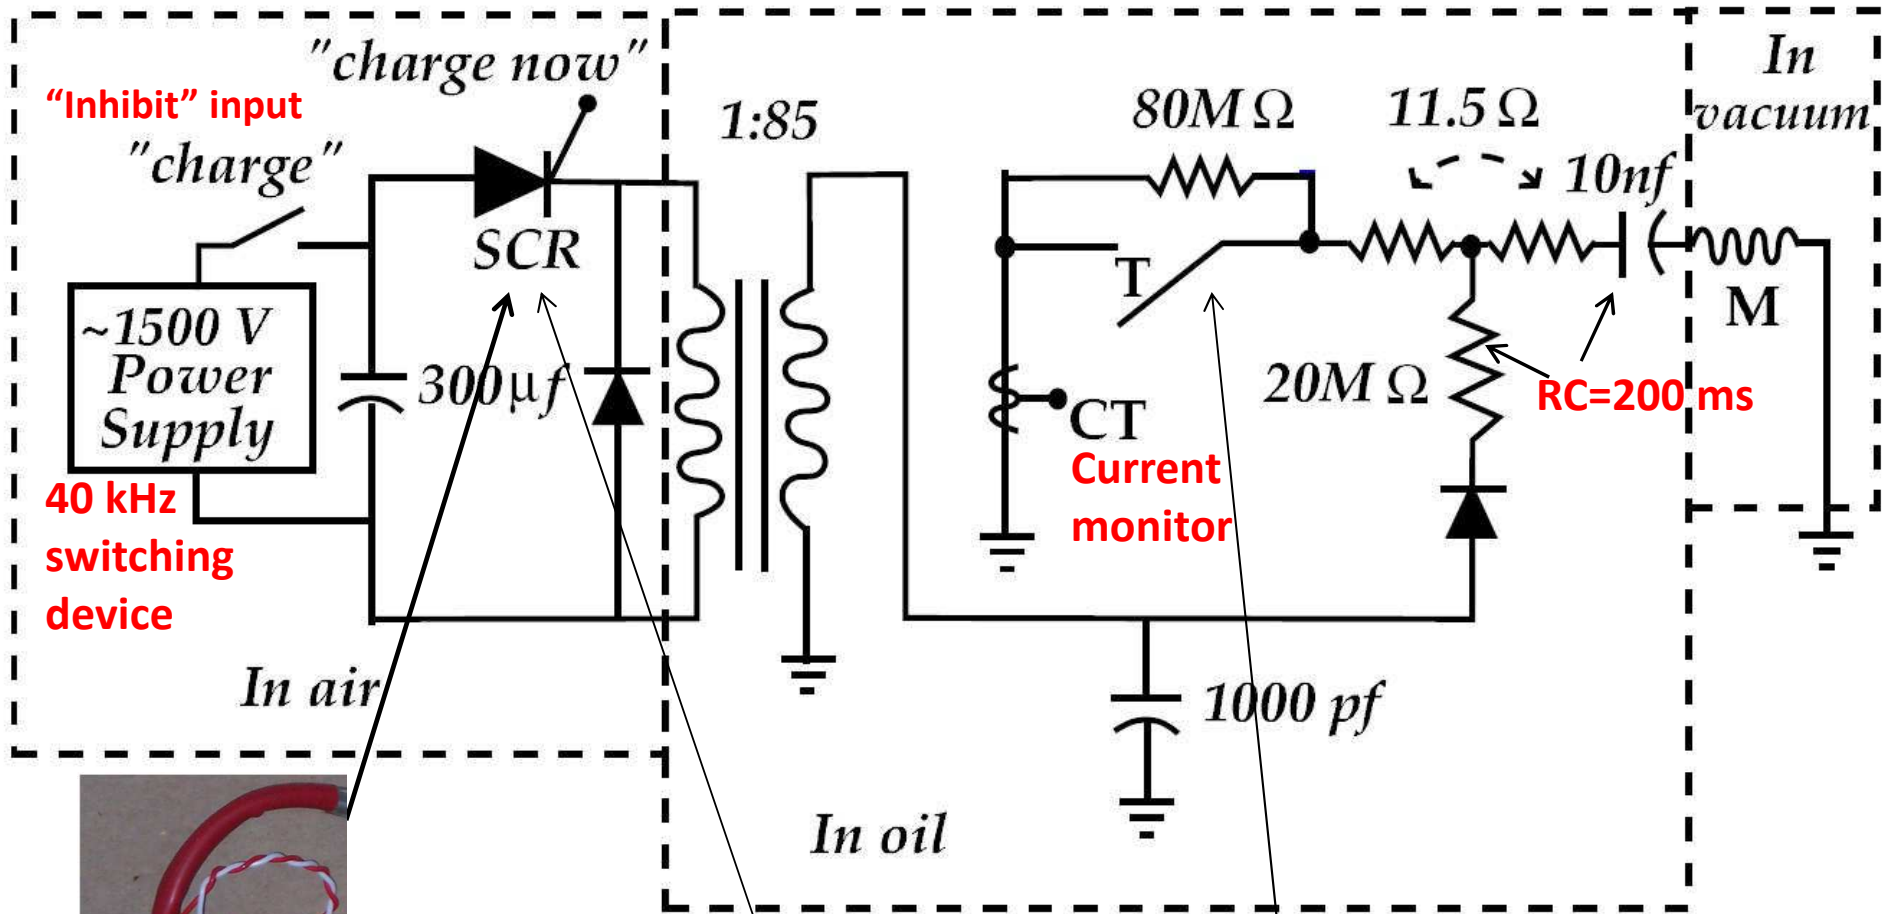

(G-2) COLLABORATION MEETING

By phone

**July 12, 2012**

# ELECTRIC SCHEME OF HV PULSER USED IN E821

RLC discharge scheme

SCR — Silicon Controlled Rectifier -Thyristor

The time between "charge now" and the thyatron triggering was  $\sim 2\text{ ms}$

Replaced  
transformer

Fully operational now

We recommend to purchase the thyatron feeding unit for the future

North Star High Voltage

Thyatron Chassis with Driver, Heater and Reservoir Power

This block **replaces** the thyatron triggering pulser, the PS for the heater, reservoir, prime, bias.

The cost is \$5500/one  
\$15000/set of three

For the reference: the cost of this  
HV PS is 12.5k\$

New HV regulation block

**System operates currently at ~35kV, 1.5 uH dummy load**  
Preparations to fill with oil, although the tubes for BL are around...

Outer tubes for the Blumlein, each tube is ~ 1.5 m long (the pulse will be ~ 50 ns)

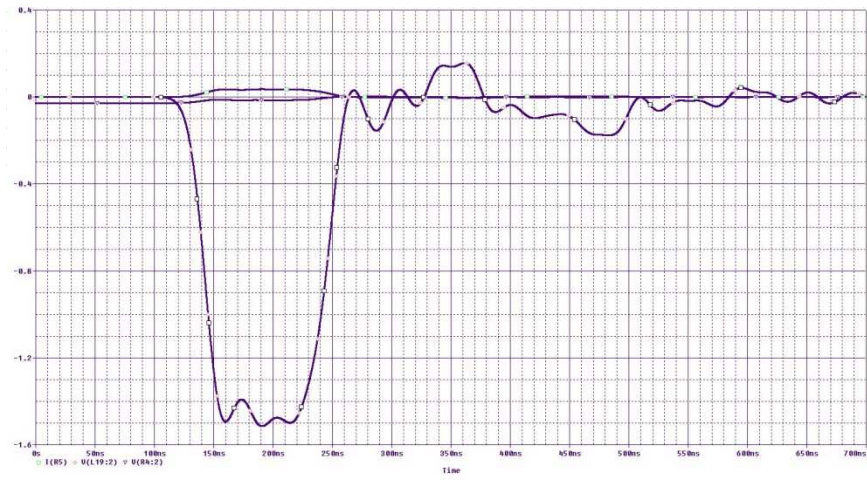

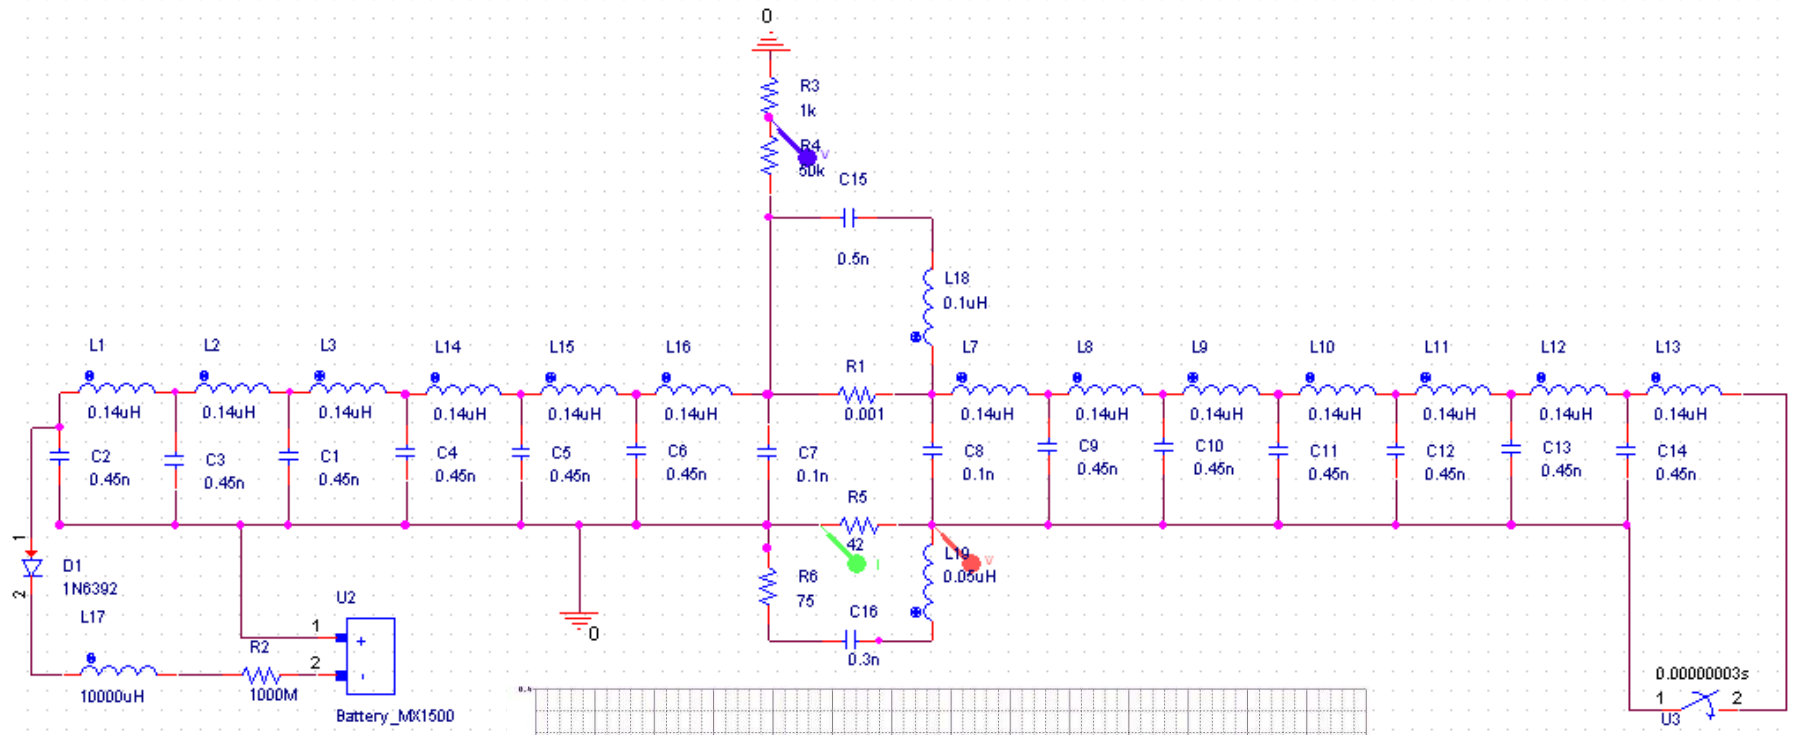

Detailed view to the flange

# Modeling with PSPICE is in progress...

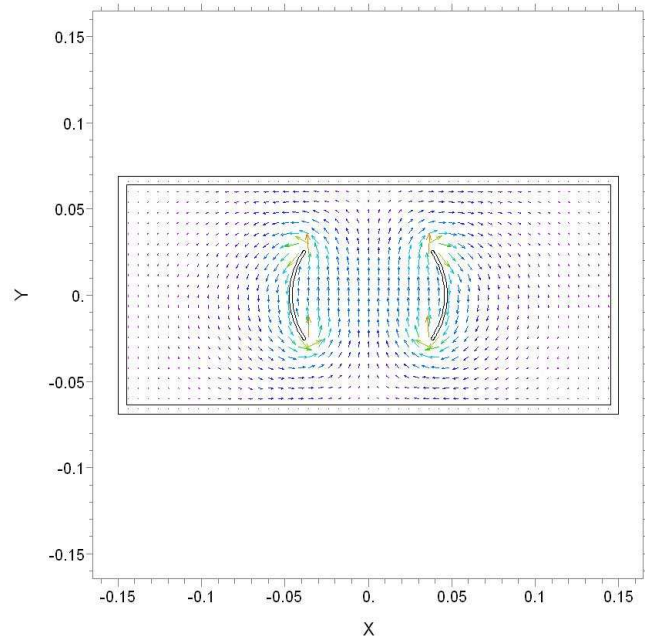

Next step will be modeling with Microwave studio,  
FlexPDE and HFSS

## 3D field calculation is in progress with FlexPDE

Plans to do this with HFSS and CTS studio (License granted)

(g-2) kicker

(g-2) kicker: Cycle=14 Time= 1.2857e-8 dt= 1.2702e-9 P2 Nodes=4633 Cells=2272 RMS Err= 1.1e-7

Field distribution in a transverse plane

(g-2) kicker 3D

Potential distribution.  
Longitudinal cut, top view

Potential for another 20% increase of kick

**This technology fights against the eddy currents as well !**

## CONCLUSIONS

### **At Cornell site right now:**

E-821 scheme restored works currently at 35; ready to be filled by oil

Numerical modeling of the time dependent fields in progress;

Arranging fast field measurements system-plans;

Detailed 3D drawings of the Blumline pulser under development.

We recommend to purchase a power supply/triggering unit for future applications (\$5500 per just single unit; \$15000 for three of them).

Spare slides

The current on the kicker plates represented in [1] in the form of

$$I(t) = I_0 e^{-\frac{\gamma}{2}t} \text{Sin}(2\pi f_d t + \varphi_d), \quad (1)$$

$$\text{where } f_d = \frac{1}{2\pi} \left(\frac{1}{LC}\right)^{1/2} \left\{1 - \frac{R^2 C}{4L}\right\}^{1/2} = \frac{1}{2\pi} \sqrt{\frac{1}{LC} - \frac{R^2}{4L^2}}$$

$$\gamma = \frac{R}{L}, \quad I_0 = \frac{V_0}{2\pi f_d L}.$$

The shape of current could be obtained also by solving the differential equation associated with the scheme from Fig.1 as the following

$$\ddot{I}(t) + \frac{1}{LC} I(t) + \frac{R}{L} \dot{I}(t) = 0 \quad (2)$$

which reflects the Kirchhoff law for the LCR circuit applied to the voltages.

Appropriate initial conditions set are  $I(0)=0, \dot{I}(0)=\dot{I}_0$

---

E.Efstihadis, *et.al.*, "A Fast Non-Ferric Kicker for the Muon (g-2) experiment", NIM, Elsevier Sci., 15 July, 2002.

The shape of current from (1) and (2) can be obtained from Mathematica©

$V_0 = 50000.$

$L = 1.6 \cdot 10^{-6}$

$C_p = 10^{-8}$

$R = 11.5$

$\gamma = R/L$

$I_0 = V_0 / 2 / \pi / f_d / L$

$$f_d = 1. / 2. / \pi * \left( \frac{1}{L C_p} \right)^{1/2} * \left( 1. - \frac{R^2 C_p}{4 L} \right)^{1/2}$$

`sol = NDSolve[{y''[t] + 1./L/Cp*y[t] + R/L*y'[t] == 0., y'[0] == 3.1010, y[0] == 0.}, y, {t, 0., 110-6}`

`Plot[Evaluate[y[t] /. sol], {t, 0., 110-6}, Frame -> True, PlotRange -> All, GridLines -> Automatic]`

`Plot[Evaluate[I0*e-γ/2.*t*Sin[2πfd t], {t, 0, 110-6}], Frame -> True, PlotRange -> All, GridLines -> Automatic]`

`Plot[Evaluate[y'[t]*L /. sol], {t, 0., 110-6}, Frame -> True, PlotRange -> All, GridLines -> Automatic]`

`ParametricPlot[Evaluate[{y[t]*R, L*y'[t]} /. sol], {t, 0., 110-6}, Frame -> True, PlotRange -> All, GridLines -> Automatic]`

Figure 2. The pulse shape obtained from (2).

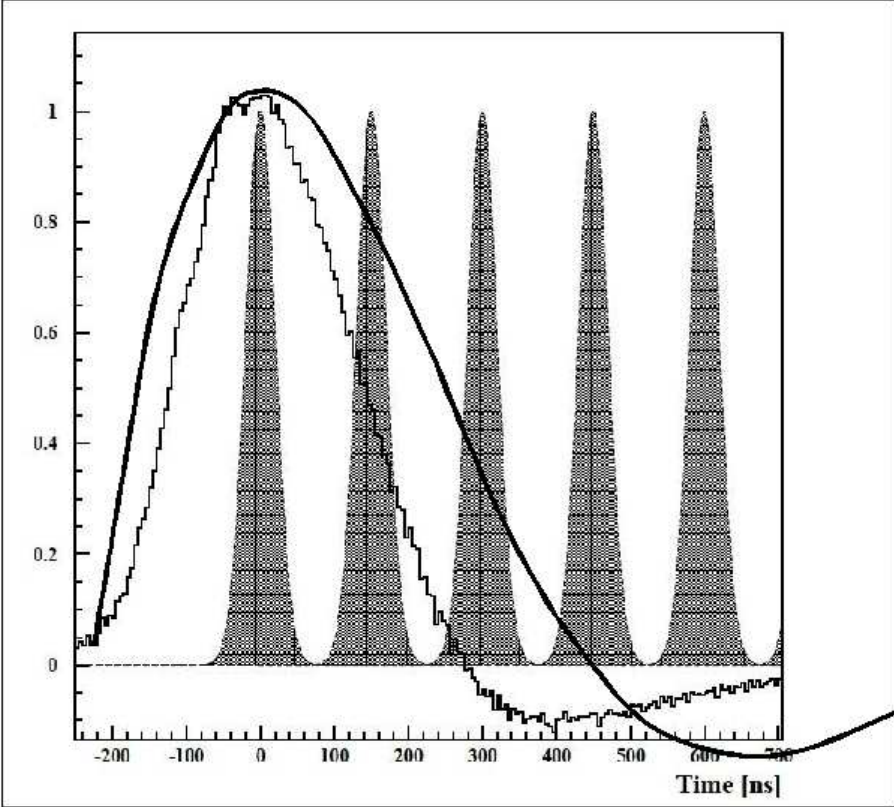

Figure 3. The pulse shape obtained from (1).

One can see that the pulses obtained by two different ways (from equation (1) and from equation (2)) are identical.

Meanwhile the current shape from previous figures, if embedded in Fig. 51 from [1] (and all other publications), become as the following

The Fig.51 from [1] with superimposed pulse shape obtained from Mathematica©.

The source of this discrepancy is under investigation.

## For modeling with PSPICE (Cadence)

- a) Original Blumlein scheme;  
 b) In a second coaxial the conductors are switched, so the potential of inner left coaxial is the same as the potential of outer right coaxial;  
 c) Right coaxial inserted into the left one. For this purposes its radiuses increased accordingly.  
 d) Final scheme.

Thin (0.4mm) Al profiled electrodes; will consider Ti also.  
Perforation might be useful.

The NMR cartridge profile

End jumper

NMR cable duct wheels

Electrodes at the end will have the chamfer (similar to the magnetic pole chamfer) for better 3D field distribution. (The same could be recommended for the electrostatic Quadrupole)

Thyratron/capacitor

HV transformer tank

Inductance  $\sim 1\mu\text{H}$

Without oil this device can operate at  $\sim 30\text{KV}$

Thyatron housing

Thyatron Terminal Box

Cathode cooling blower

Thyatron Triggering  
cable (red)

Other view

For the Blumlein generator prototyping this 1.5 m-long section will be extended by 4 meters

This will allow having 50ns flat top pulse  
Fits in the room

Three sections of the Blumlein generator in a machine shop.

Few triaxial Blumlein generators at RHIC inflector

4-channel timing unit

Even slightly bent **Quadrupole** electrodes deliver much better field quality.

Flat electrodes (E-821)

Slightly bend electrodes
